

**Md. Ruhul Kuddus**

## **Assignment: Module 18**

**Question-1:** Create a new migration file to add a new table named "categories" to the database. The table should have the following columns:

id (primary key, auto-increment), name (string), created\_at (timestamp) ,updated\_at (timestamp)

**Command:**

```
$ php artisan make:migration create_categories_table
```

**Migration:**

```
1  <?php
2  use Illuminate\Database\Migrations\Migration;
3  use Illuminate\Database\Schema\Blueprint;
4  use Illuminate\Support\Facades\Schema;
5
6  return new class extends Migration {
7      /**
8       * Run the migrations.
9       */
10     public function up(): void{
11         Schema::create( 'categories', function ( Blueprint $table ) {
12             $table->id();
13             $table->string( 'name', 50 );
14             $table->timestamp( 'created_at' )->useCurrent();
15             $table->timestamp( 'updated_at' )->useCurrent()->useCurrentOnUpdate();
16         } );
17     }
18     /**
19      * Reverse the migrations.
20      */
21     public function down(): void{
22         Schema::dropIfExists( 'categories' );
23     }
24 };
```

### Question-2:

Create a new model named "Category" associated with the "categories" table. Define the necessary properties and relationships.

Command:

```
$ php artisan make:model Category
```

Model:

```
1  <?php
2
3  namespace App\Models;
4  use Illuminate\Database\Eloquent\Factories\HasFactory;
5  use Illuminate\Database\Eloquent\Model;
6
7  class Category extends Model {
8
9      use HasFactory;
10     protected $table = 'categories';
11     protected $fillable = ['name'];
12
13 }
```

**Question-3:** Write a migration file to add a foreign key constraint to the "posts" table. The foreign key should reference the "categories" table on the "category\_id" column.

Command:

```
$ php artisan make:migration add_foreign_key_to_posts_table
```

## Migration:

```
1  <?php
2
3  use Illuminate\Database\Migrations\Migration;
4  use Illuminate\Database\Schema\Blueprint;
5  use Illuminate\Support\Facades\Schema;
6
7  return new class extends Migration {
8      /**
9       * Run the migrations.
10      */
11      public function up(): void{
12          Schema::table( 'posts', function ( Blueprint $table ) {
13              $table->foreignId( 'category_id' )->constrained()
14                  ->cascadeOnUpdate()->cascadeOnDelete();
15          } );
16      }
17
18      /**
19       * Reverse the migrations.
20      */
21      public function down(): void{
22          Schema::table( 'posts', function ( Blueprint $table ) {
23              $table->dropForeign( [ 'category_id' ] );
24              $table->dropColumn( 'category_id' );
25          } );
26      }
27  };
```

**Question-4:** Create a relationship between the "Post" and "Category" models. A post belongs to a category, and a category can have multiple posts.

## Model of Category:

```
1  <?php
2
3  namespace App\Models;
4
5  use Illuminate\Database\Eloquent\Factories\HasFactory;
6  use Illuminate\Database\Eloquent\Model;
7  use Illuminate\Database\Eloquent\SoftDeletes;
8
9  class Post extends Model {
10      use HasFactory, SoftDeletes;
11      protected $guarded = [];
12      public function category() {
13          return $this->belongsTo( Category::class );
14      }
15  }
16
17  }
```

### Model of Post:

```
1  <?php
2
3  namespace App\Models;
4
5  use Illuminate\Database\Eloquent\Factories\HasFactory;
6  use Illuminate\Database\Eloquent\Model;
7  use Illuminate\Database\Eloquent\SoftDeletes;
8
9  class Post extends Model {
10     use HasFactory, SoftDeletes;
11     protected $guarded = [];
12     public function category() {
13         return $this->belongsTo( Category::class );
14     }
15 }
16
17
```

**Question-5:** Write a query using Eloquent ORM to retrieve all posts along with their associated categories. Make sure to eager load the categories to optimize the query.

### Controller:

```
class AssignmentController extends Controller {

    public function allPostWithCategory() {
        $posts = Post::with( 'category' )->get();
        return $posts;
    }

}
```

**Question-6:** Implement a method in the "Post" model to get the total number of posts belonging to a specific category. The method should accept the category ID as a parameter and return the count.

**Model of Post:**

```
function categoryWisePostCount( $categoryId ) {  
    return self::where( 'category_id', $categoryId )->count();  
}
```

**Route:**

```
Route::get( '/categoryPostCount', function () {  
    $categories = Category::all();  
    return view( 'category_wise_post_count', compact( 'categories' ) );  
} );
```

**Blade:**

```
<body>  
    <div class="container">  
        <div class="row mt-5">  
            <div class="col-md-6">  
                <table class="table table-striped table-bordered">  
                    <thead>  
                        <tr>  
                            <th scope="col">Category Name</th>  
                            <th scope="col">Total Post</th>  
                        </tr>  
                    </thead>  
                    <tbody>  
                        @foreach ($categories as $category)  
                            <tr>  
                                <td>{{ $category->name }}</td>  
                                <td>{{ App\Models\Post::categoryWisePostCount($category->id) }}</td>  
                            </tr>  
                        @endforeach  
                    </tbody>  
                </table>  
            </div>  
        </div>  
    </div>  
</body>
```

**Question-7:** Create a new route in the web.php file to handle the following URL pattern: "/posts/{id}/delete". Implement the corresponding controller method to delete a post by its ID. Soft delete should be used.

Use the `SoftDeletes` trait Post model:

```
use HasFactory, SoftDeletes;
```

Migration:

```
php artisan make:migration add_deleted_at_to_posts_table
```

Run migration:

```
php artisan migrate
```

Route:

```
Route::delete( '/posts/{id}/delete', [AssignmentController::class, 'softDelete'] );
```

Controller:

```
public function softDelete( Request $request ) {  
    $post = Post::find( $request->id );  
    if ( !$post ) {  
        return response()->json( ['message' => 'Post not found'], 404 );  
    }  
    $post->delete();  
    return response()->json( ['message' => 'Post soft deleted successfully'] );  
}
```

**Question-8:** Implement a method in the "Post" model to get all posts that have been soft deleted. The method should return a collection of soft deleted posts.

**Post Model:**

```
public static function softDeletedPosts(){  
    return self::onlyTrashed()->get();  
}
```

**Route:**

```
Route::get( '/softDeletedPosts', [AssignmentController::class, 'softDeletedPosts'] );
```

**Controller:**

```
public function softDeletedPosts() {  
    $softDeletedPosts = Post::softDeletedPosts();  
    return $softDeletedPosts;  
}
```

**Question-9:** Write a Blade template to display all posts and their associated categories. Use a loop to iterate over the posts and display their details.

**Route:**

```
Route::get( 'all_post_with_category', [AssignmentController::class, 'all_post_with_category'] );
```

**Controller:**

```
public function all_post_with_category() {  
    $posts = Post::with( 'category' )->get();  
    return view( 'display_all_post_with_category', compact( 'posts' ) );  
}
```

**Blade:**

```
<div class="row gx-5 justify-content-center">  
    <div class="col-lg-11 col-xl-9 col-xxl-8">  
        @foreach ($posts as $post)  
            <!-- Project Card 1-->  
            <div class="card overflow-hidden shadow rounded-4 border-0 mb-5">  
                <div class="card-body p-0">  
                    <div class="d-flex align-items-center">  
                        <div class="p-5">  
                            <p><b>Post Title: </b>{{ $post->title }}</p>  
                            <p><b>Category: </b>{{ $post->category->name }}</p>  
                        </div>  
                    </div>  
                </div>  
            </div>  
        @endforeach  
    </div>  
</div>
```

**Question-10:** Create a new route in the web.php file to handle the following URL pattern: "/categories/{id}/posts". Implement the corresponding controller method to retrieve all posts belonging to a specific category. The category ID should be passed as a parameter to the method.

**Route:**

```
Route::get( '/categories/{id}/posts', [AssignmentController::class, 'specificCatPosts'] );
```

**Controller:**

```
public function specificCatPosts( Request $request ) {  
    $posts = Post::where( 'category_id', $request->id )->get();  
    return $posts;  
}
```

**Question-11:** Implement a method in the "Category" model to get the latest post associated with the category. The method should return the post object.

**Post Model:**

```
public function latestPost() {  
    return $this->posts()->latest()->first();  
}
```

**Route:**

```
Route::get( '/catLatestPost/{id}', function ( Request $request ) {  
    $category = Category::find( $request->id );  
    if ( $category ) {  
        $latestPost = $category->latestPost();  
        return $latestPost;  
    } else {  
        return response()->json( ['message' => 'Category not found'], 404 );  
    }  
} );
```

### Question-12:

Write a Blade template to display the latest post for each category. Use a loop to iterate over the categories and display the post details.

### Route:

```
Route::get( '/eachCategoryPosts', [AssignmentController::class, 'eachCategoryPosts'] );
```

### Controller:

```
public function eachCategoryPosts() {  
    $categories = Category::all();  
    return view( 'each_category_post_loop', compact( 'categories' ) );  
}
```

### Blade:

```
<section class="py-5">  
    <div class="container px-5 mb-5">  
        <div class="text-center mb-5">  
            <h1 class="display-5 fw-bolder mb-0"><span class="text-gradient d-inline">Latest post for each  
                category</span></h1>  
        </div>  
        <div class="row gx-5 justify-content-center">  
            <div class="col-lg-11 col-xl-9 col-xxl-8">  
                @foreach ($categories as $key => $category)  
                    <!-- Project Card 1-->  
                    <h2>{{ $category->name }}</h2>  
                    @if ($category->latestPost())  
                        <p><b>Post Title: </b>{{ $category->latestPost()->title }}</p>  
                    @else  
                        <p>No posts available for this category.</p>  
                    @endif  
                    <hr>  
                @endforeach  
            </div>  
        </div>  
    </div>  
</section>
```
